Practice Exercises

1. Customer Purchase Summary Report

You have received transaction data from customer purchases at electronic store as given below:

```
transactions = [
    {"customer": "Alex", "product": "Laptop", "amount": 1200},
    {"customer": "Jay", "product": "Mouse", "amount": 25},
    {"customer": "Jammie", "product": "Headphones", "amount": 150},
    {"customer": "Alex", "product": "Keyboard", "amount": 75},
    {"customer": "Jammie", "product": "Monitor", "amount": 300},
]
```

You need to calculate the **total amount spent** by each customer and display the result in a clean format.

Expected Output: The output should look like

```
Alex spent a total of $1275
Jay spent a total of $25
Jammie spent a total of $450
```

2. Stock Portfolio Tracker

You are an investor and your current stock holdings are given below:

```
portfolio = {
    "AAPL": {"shares": 10, "price": 1250.3},
    "GOOGL": {"shares": 5, "price": 2800.5},
    "TSLA": {"shares": 8, "price": 190.1}
}
```

To compute current portfolio value, follow these steps:

Step 1: Multiply share counts and price for each stock

Step 2: Calculate the total value of the portfolio and print the individual stock values too

[Hint: Use a **`for`** loop to iterate over **`portfolio`** dictionary.]

The objective of these exercises is to demonstrate how **`for`** *loop can be used to iterate over given iertable.*
